              }
         matrix = ans.matrix;
     void pow(int p) {
         Mat x = *this;
*this = unit(n):
         while (p > 0) {
             if (p & 1)
                   mul(x);
              x.mul(x);
              p >>= 1;
         }
    }
int n, ans; cin >> n;
if (n <= 4) {
    vector < int >> v = {0, 1, 1, 2, 4};
         ans = v[n];
         Mat mat({{4, 2, 1}, {2, 1, 1}, {1, 1, 0}});
         Mat x(3);
         x.matrix = \{\{1, 1, 0\}, \{1, 0, 1\}, \{1, 0, 0\}\};
         x.pow(n - 4);
mat.mul(x);
         ans = mat.matrix[0][0];
    cout << ans << "\n";
// 初始矩陣
                轉移式
// f4 f3 f2
                1 1 0
                           f5 f4 f3
// f3 f2 f1
// f2 f1 f0
               1 0 1 => f4 f3 f2
1 0 0 f3 f2 f1
```

6.3 盧卡斯定理 [2d6ffd]

```
p >>= 1;
}
return ans;
}
vector < int > fac;
void buildFac(int n) {
    fac.resize(n + 1);
    fac[0] = 1;
    for(int i = 1; i <= n; i++) {
        fac[i] = fac[i - 1] * i % mod;
    }
}
int C(int m, int n) {
    return m < n ? 0 : fac[m] *
        inverse(fac[n]) % mod * inverse(fac[m - n]) % mod;
}
int Lucas(int m, int n) {
    return n == 0 ? 1 % mod : Lucas
        (m / mod, n / mod) * C(m % mod, n % mod) % mod;
}
};</pre>
```

6.4 樹論分塊 [99629d]

6.5 Mobius Theorem

- 數論分塊可以快速計算一些含有除法向下取整的和式,就是像 $\sum_{i=1}^n f(i)g(\left\lfloor \frac{n}{i} \right\rfloor)$ 的和式。當可以在 O(1) 內計算 f(r)-f(l) 或已經預處理 出 f 的前綴和時,數論分塊就可以在 $O(\sqrt{n})$ 的時間內計算上述和式的值。
- 迪利克雷捲積 $h(x) = \sum_{d|x} f(d)g(\frac{x}{d})$
- 積性函數
 - 莫比烏斯函數
 - 1. 定義

$$\sum_{d\mid n} \mu(d) = \begin{cases} 1 & \text{for } n=1\\ 0 & \text{for } n\neq 0 \end{cases}$$

- 2. μ 是常數函數 1 的反元素 $\Rightarrow \mu*1=\epsilon$, $\epsilon(n)$ 只在n=1時為 1,其餘情況皆為 0。
- $-\phi$ 歐拉函數: x以下與x互質的數量

$$\begin{split} \phi \! * \! 1 \! &= \! \sum_{d \mid n} \! \phi(\frac{n}{d}) \text{ 質因數分解} \\ &= \! \sum_{i=0}^{c} \! \phi(p^i) \\ &= \! 1 \! + \! p^0(p \! - \! 1) \! + \! p^1(p \! - \! 1) \! + \! \dots \! + \! p^{c-1}(p \! - \! 1) \\ &= \! p^c \\ &= \! id \end{split}$$

• 莫比烏斯反演公式

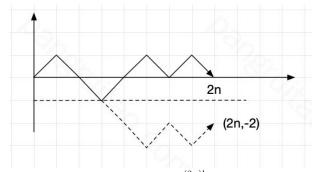

```
- f(n) = \sum_{d|n} g(d) \Leftrightarrow g(n) = \sum_{d|n} \mu(d) f(\frac{n}{d})

- f(n) = \sum_{n|d} g(d) \Leftrightarrow g(n) = \sum_{n|d} \mu(\frac{d}{n}) f(d)
```

例子

$$\begin{split} &\sum_{i=a}^{b} \sum_{j=c}^{d} [gcd(i,j) = k] \\ &\Rightarrow \sum_{i=1}^{x} \sum_{j=1}^{y} [gcd(i,j) = k] \\ &= \sum_{i=1}^{\left\lfloor \frac{x}{k} \right\rfloor} \left\lfloor \frac{y}{k} \right\rfloor \\ &= \sum_{i=1}^{x} \sum_{j=1}^{y} \epsilon(gcd(i,j)) \\ &= \sum_{i=1}^{x} \sum_{j=1}^{y} \sum_{d|gcd(i,j)} \mu(d) \\ &= \sum_{d=1}^{\infty} \mu(d) \sum_{i=1}^{\left\lfloor \frac{y}{k} \right\rfloor} \left\lfloor \frac{y}{k} \right\rfloor \left\lfloor \frac{y}{k} \right\rfloor \\ &= \sum_{d=1}^{min(\left\lfloor \frac{x}{k} \right\rfloor, \left\lfloor \frac{y}{k} \right\rfloor)} \\ &= \sum_{d=1}^{min(\left\lfloor \frac{x}{k} \right\rfloor, \left\lfloor \frac{y}{k} \right\rfloor)} \mu(d) \left\lfloor \frac{x}{kd} \right\rfloor \left\lfloor \frac{y}{kd} \right\rfloor \end{split}$$

Catalan Theorem

- 1. n 個往上n 個往下,先枚舉所有情況 $\frac{(2n)!}{n!n!} = C_n^{2n}$
- 2. 扣掉非法的,有多少種可能讓最後的點落在(2n,-2) 假設往上有 x 個,往下有 y 個,會有:

$$\begin{cases} x+y=2n \\ y-x=2 \end{cases} \Rightarrow \begin{cases} x=n-1 \\ y=n+1 \end{cases}$$

所以只要扣掉 C_{n-1}^{2n} 即可

6.7 Burnside's Lemma

States that total number of distinct object is: $\sum_{k=1}^{N} \frac{c(k)}{N}$

- ullet c(k) is the number of combination that remains unchanged when Kth rotation is applied
- ${\it N}$ is the total number of ways to change the position of ${\it N}$ elements.

6.8 莫比烏斯反演 [d41d8c]

```
const int maxn = 2e5;
int mobius_pref[maxn];
void init() {
     mobius_pref[1] = 1;
     vector<int> wei
     (maxn); // wei = 0 代表是質數, -1 代表可被平方數整除
for (int i = 2; i < maxn; i++) {
    if (wei[i] == -1) {
                mobius_pref[i] = mobius_pref[i - 1];
                continue; // 包含平方
          fif (wei[i] == 0) {
    wei[i] = 1;
    for (int j = 2; i * j < maxn; j++) {
        if (j % i == 0) wei[i * j] = -1;
        else if (wei[i * j] != -1) wei[i * j]++;
}</pre>
           mobius pref[i]
                 = mobius_pref[i - 1] + (wei[i] % 2 == 0 ? 1 : -1);
    }
void solve() {
     int a, b, c, d, k; cin >> a >> b >> c >> d >> k;
auto cal = [&](int x, int y) -> int {
           int res = 0;
```

```
cout << cal
                (b / k, d / k) - cal((a - 1) / k, d / k) - cal(b / k, (c - 1) / k) + cal((a - 1) / k, (c - 1) / k) << "\n";
}
```

Search and Gready

二分搜 [d41d8c]

```
int main() {
        int l'= 1, r = 10;
       // 1 to tar, find tar
while (l <= r) {
   int m = (l + r) / 2;
              if (check(m)) l = m + 1;
              else r = m - 1;
       cout << r;
       // tar to end
while (l <= r) {
    int m = (l + r) / 2;
    if (check(m)) r = m - 1;
    else l = m + 1;
       cout << l:
}
```

7.2 三分搜 [d41d8c]

```
// 找極值問題,遞增遞減
void solve() {
    int l = 0, r = 10, ans = 0; // ans 紀錄答案 while (l <= r) {
                                 // 差
         int d = (r - l) / 3;
         int ml = l + d, mr = r - d; // mr 要用減的
         auto cal = [&](int m) -> int {
             int x = 0:
             return x;
