1 Basic

1.1 install vscode [d41d8c]

```
|// 如何安裝 vscode
|// 1. 下載 vscode & msys2
|// 2. 在跳出的 terminal 中 / 或打開 ucrt64,打上
    "pacman -S --needed base-devel mingw-w64-x86_64-toolchain"
|// 3. 環境變數加上 C:\\msys64\\ucrt64\\bin
|// 4. 重開 vscode, 載 C/C++, 運行, 編譯器選擇 g++
|// 5. 打開 settings -> compiler -> add compilerPath
    -> 在 "" 裡打上 C:\\msys64\\ucrt64\\bin\\g++.exe
```

1.2 default code [bee7dd]

```
#include <bits/stdc++.h>
#define all(x) (x).begin(), (x).end()
#define pit pair<int, int>
#define endl "|n"
#define int long long
using namespace std;

const int llinf = 4e18;
const int inf = 2e9;
const int mod = 1e9 + 7;
const int maxn = 2e5 + 5;

void solve() {
}

signed main() {
   ios_base::sync_with_stdio(0);
   cin.tie(nullptr);
   int t = 1;
   cin >> t;
   while (t--) {
       solve();
   }
}
```

1.3 compare fuction [4bc3e0]

```
struct cmp {
       vector<int> &v;
       cmp(vector<int>& vec) : v(vec) {}
       bool operator() (int a, int b) const {
            // 根據外
                  部向量來比較元素的優先級,記得不要改到比較 vector
            return v[a] > v[b];
/// main: cmp cmp1(vector);
// priority_queue<int, vector<int>, cmp> pq(cmp1);
};
 1.4 pbds [e28ae8]

   *this = unit(n);
           while (p > 0) {
   if (p & 1)
                     mul(x);
                x.mul(x);
           }
     }
signed main() {
   int n, ans; cin >> n;
   if (n <= 4) {</pre>
           vector<int> v = {0, 1, 1, 2, 4};
           ans = v[n];
           Mat mat({{4, 2, 1}, {2, 1, 1}, {1, 1, 0}});
           Mat x(3);

x.matrix = \{\{1, 1, 0\}, \{1, 0, 1\}, \{1, 0, 0\}\};
           x.pow(n - 4);
           mat.mul(x);
           ans = mat.matrix[0][0];
      cout << ans << "\n";
}
// 初始矩陣
                   轉移式
// f3 f2 f1
// f2 f1 f0
                  1 1 0
                  1 0 1 => f4 f3 f2
1 0 0 f3 f2 f1
```

6.3 盧卡斯定理 [fdcf53]

```
struct nCr {
     nCr(int mod) : mod(mod) {};
int inverse(int num) {
         if (num == 1) return 1;
         int fast_exp(int x, int p) {
         int ans = 1;
while (p > 0) {
    if (p & 1) ans = (ans * x) % mod;
    x = x * x % mod;
    p >>= 1;
         return ans;
     vector<int> fac;
     void BuildLucas(int n) {
         fac.resize(n + 1);
         fac[0] = 1;
for(int i = 1; i <= n; i++) {
    fac[i] = fac[i - 1] * i % mod;</pre>
     int C(int m, int n) {
    return m < n ? 0 : fac[m] *</pre>
               inverse(fac[n]) % mod * inverse(fac[m - n]) % mod;
     }
};
```

6.4 樹論分塊 [99629d]

6.5 Theorem

- 數論分塊可以快速計算一些含有除法向下取整的和式,就是像 $\sum_{i=1}^n f(i)g(\left\lfloor \frac{n}{i} \right\rfloor)$ 的和式。當可以在O(1)內計算f(r)-f(l)或已經預處理出f的前綴和時,數論分塊就可以在 $O(\sqrt{n})$ 的時間內計算上述和式的值。
- 迪利克雷捲積 $h(x) = \sum_{d|x} f(d) g(\frac{x}{d})$

- 積性函數
 - 莫比烏斯函數
 - 1. 定義

$$\sum_{d\mid n}\!\!\mu(d)\!=\!\begin{cases} 1 & \text{for } n\!=\!1\\ 0 & \text{for } n\!\neq\!0 \end{cases}$$

- 2. μ 是常數函數 1 的反元素
- $\Rightarrow \mu*1=\epsilon$, $\epsilon(n)$ 只在n=1時為 1,其餘情況皆為 0。
- $-\phi$ 歐拉函數: x以下與x互質的數量

$$\phi*1 = \sum_{d|n} \phi(\frac{n}{d})$$
 質因數分解
= $\sum_{i=0}^{c} \phi(p^{i})$
= $1 + p^{0}(p-1) + p^{1}(p-1) + \dots + p^{c-1}(p-1)$
= p^{c}
= id

- 莫比烏斯反演公式
 - $f(n) = \sum_{d|n} g(d) \Leftrightarrow g(n) = \sum_{d|n} \mu(d) f(\frac{n}{d})$
 - $f(n) = \sum_{n|d} g(d) \Leftrightarrow g(n) = \sum_{n|d} \mu(\frac{d}{n}) f(d)$
- 例子

$$\begin{split} &\sum_{i=a}^{b} \sum_{j=c}^{d} [gcd(i,j) = k] \\ &\Rightarrow \sum_{i=1}^{x} \sum_{j=1}^{y} [gcd(i,j) = k] \\ &= \sum_{i=1}^{\left\lfloor \frac{x}{k} \right\rfloor} \left\lfloor \frac{y}{k} \right\rfloor \\ &= \sum_{i=1}^{x} \sum_{j=1}^{y} \epsilon(gcd(i,j)) \\ &= \sum_{i=1}^{x} \sum_{j=1}^{y} \sum_{d|gcd(i,j)} \mu(d) \\ &= \sum_{d=1}^{\infty} \mu(d) \sum_{i=1}^{\left\lfloor \frac{y}{k} \right\rfloor} \left\lfloor \frac{y}{k} \right\rfloor \left\lfloor \frac{y}{k} \right\rfloor \\ &= \sum_{d=1}^{min(\left\lfloor \frac{x}{k} \right\rfloor, \left\lfloor \frac{y}{k} \right\rfloor)} \\ &= \sum_{d=1}^{min(\left\lfloor \frac{x}{k} \right\rfloor, \left\lfloor \frac{y}{k} \right\rfloor)} \mu(d) \left\lfloor \frac{x}{kd} \right\rfloor \left\lfloor \frac{y}{kd} \right\rfloor \end{split}$$

6.6 莫比烏斯反演 [d41d8c]

```
const int maxn = 2e5;
int mobius_pref[maxn];
void init() {
       mobius_pref[1] = 1;
       vector<int> wei
